

**Boca Meadow Habitat Restoration Project – Request for Information**  
**Bids Due April 12, 2024**

*The information provided below details questions posed by consultant teams via email correspondence with Project Director, Eben Swain. Response to questions is noted in the information provided below.*

**General Info**

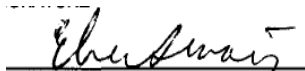

**Q.** Has a site survey of the project site already been conducted that will provide topographical data sufficient for construction documents? Or will this need to be updated/completed in the future by the consultant?

**A.** Topographical surveys have not been conducted for this project. Appropriate surveys are anticipated to be a necessary work task that will help to inform the basis of project design and implementation. Surveys will provide necessary information on both existing conditions and proposed conditions within the project site and will help to inform the preferred alternative for proposed restoration actions. Review and use of LiDAR data may help to inform design criteria and restoration actions, but due to site complexities, we also anticipate that actual on-the-ground surveys (such as RTK) may be a necessary component to inform key design elements and to provide guidance for implementation actions.

**Q.** The RFP mentions a 60% and 65% design plan set at different places in the document. We'd like to clarify which number is correct for the proposal: 60, or 65%?

**A.** 65% design is correct.

Sincerely,

Eben Swain, Project Director
